Summary

I am Andrey Luiz, a versatile software engineer with strong proficiency in both frontend and backend development. My experience spans a variety of programming languages, including JavaScript, Python, and Java. Over the years, I've worked on diverse projects across multiple industries, from developing finance and digital marketing platforms to government applications and sports equipment rental apps. Notable roles include Full Stack Engineer at Equip and Frontend Engineer at Scout24 Schweiz AG. My technological expertise is broad, with substantial experience in React.js, Redux.js, and Git. Currently, I'm contributing to the code quality platform SonarCloud at Sonar. I thrive in collaborative environments and eagerly embrace the challenges of new technologies and work models.

Experience

Frontend Developer

Sonar

Nov 2022 - Present (9 months)

At Sonar, I collaborate with the SonarCloud platform to deliver to our users good code quality fast and reliably.

Full Stack Engineer

Equip Sport

Jun 2021 - Nov 2022 (1 year 6 months)

Equip is an app to provide sports on demand. With a few easy steps, you can rent sports equipment, such as SUP boards, volleyball balls, tennis rackets, etc.

We have stations in Switzerland, France, Spain, and the USA, and we have several to install across Europe and USA.

My responsibilities are on the app development and maintenance. The app is available in Play Store and Apple Store and is in active development (search by "equip sport").

Frontend Engineer

Scout24 Schweiz AG

Feb 2020 - Sep 2021 (1 year 8 months)

My mission was to collaborate in the technological improvement of the website anibis.ch.

Most of the website is built with Asp.NET. But the technology is old and hard to maintain. The web pages are being migrated to more advanced technologies such as micro-services and React.

I developed and maintained the messenger built into the platform for most of my time.

Full Stack Engineer

Integer Consulting

Feb 2018 - Jan 2020 (2 years)

I worked with small projects, in the outsourcing work model.

Each project with different colleagues, techniques, and work models. It's something challenging.

When I worked there, I created solutions for clients with Python and React.js. The most notable of the clients I worked for was the British Sky Broadcasting, where I was part of a team developing a product to run on Smart TVs.

Check my projects to know more details.

Frontend Engineer

Datarisk

Jan 2017 - Feb 2018 (1 year 2 months)

In this project, I worked in the development of a platform for finance companies and banks.

The platform used Machine Learning to place scores in data models for our clients.

I created the Frontend from scratch, without the use of any boilerplates such as CRA.

I worked together with two back-end developers and a designer. And we used the Scrum framework for organising the work.

Frontend Engineer

RD Station

Apr 2016 - Dec 2016 (9 months)

This employer has a big platform for digital marketing. It is the biggest in Brazil.

The application is made with Ruby on Rails. And I worked in the Frontend.

The Frontend had some heavy use of bootstrap at that time, and it was written in JavaScript and jQuery.

It was very nice to work with this employer because I got a nice experience with pure JavaScript.

Frontend Developer

Kanoah

Jun 2015 - Dec 2015 (7 months)

This project was short, but I had a very nice experience with Angular.js.

The product was a JIRA plugin for test management. Today this product is part of the Adaptivist collection.

The application was already built when I arrived, but I developed important features. These features allowed us to have clients all across the world.

Full Stack Developer

Softplan

Mar 2014 - Jun 2015 (1 year 4 months)

I worked with Java in this experience.

The application was responsible for importing data from the government applications and storing it in the database. Later on, this data would be used to generate charts and more accurate data.

There was not too much Frontend involved in this experience. But I developed some useful interfaces for showing progress and response to the user.

Power Builder Developer

CISS S.A - Gestão para o Varejo

Sep 2011 - Dec 2013 (2 years 4 months)

This was my first long-term experience with programming. I worked with PowerBuilder and a little bit of C#.

I collaborated with maintenance and bug fixing for the main application of the company, and also for the accounting application. After 1 year, I started working solely with new features.

Education

Faculdade Unilagos

Software Engineering, Computer Software Technology/Technician

2009 - 2011

It was an introductory course. The focus was not only on coding but also on databases, charts, planning, requirements and etc.

For development, we used Delphi and Java. But during the course, I started studying Python (way funnier). I still use Python for some small projects.

Skills

TypeScript • Redux.js • Cascading Style Sheets (CSS) • JavaScript • Svelte • React.js • Git • HTML 5 • CSS 3 • Python (Programming Language)
