### 2017 - Present Mobile application developer

*Freelancer*

Most of my experience has involved freelancing projects. I used Kotlin and Java for mobile app development in the past. Now, I mostly use the Flutter framework for both mobile and web app development. As a freelancer, I have had to create API endpoints using the Django framework in some cases.

### 2018 -2019 Android developer

*Coffice / Servicechi*

-I worked as an Android developer for two startups at Tivan Club.

-In these projects, I used Neshan Map and the MVVM architecture, as well as Firebase.

-The UI/UX was designed using Adobe XD, and I implemented it using XML and custom views.

### 2018 - Present Programming instructor

*Tosinso / Faranesh*

I made several online programming courses such as JavaFX, Kotlin, Flutter

## SKILLS & EXPERTIZE

Flutter

Kotlin

Dart

Java

## Projects

---

### Mantegh web app - Flutter

The Mantegh web app is a warehousing management system. The old project was built with Vue.js, and I was responsible for rebuilding it in Flutter.

In this project, I created a custom table for data with pagination and lazy loading from scratch, without using any built-in base table classes

For formatting only-digits input, Flutter doesn't recognize the Farsi numbers keyboard. So, I created custom formatting that converts Farsi numbers to Latin.

### E-learning application - Flutter

This is an e-learning application I created for both the mobile app and web services using Django. For bank payments, I used the IDPay service. The authentication system is based on JWT

### Wordpress application - Flutter

I have created several applications for the WordPress CMS. In these applications, users can read posts, save them, leave comments, and more.

### Coffice - Kotlin

Coffice is an Android application that allows users to make café reservations. In this project, I used the Java language with MVVM architecture and data binding.
