Flat Plus Vape Pen Instructions; Dealing with Clogging

Clogging in a vape pen can occur due to the accumulation of oils and distillates along the duct walls, which hinders the smooth passage of vapor into the lungs. The thickening of these substances can eventually oversaturate the wick, making it difficult for the coil to reach the proper temperature and produce thick, smooth vapor clouds.

To fix clogging do this; take a breath through the mouthpiece instead of your lungs, as this may cause duct pressure to push the collected distillate out of the way. Also, use heat to soften crystalline distillates, such as setting the vape pen near a heater, holding the vaporizer over a heat source, applying a hot air dryer to the cartridge, soaking the vape pen in warm water, and inserting a small tool into the mouthpiece to twist and pull the clogged distillate can also be another alternative.

To prevent clogging also do this; keep the vape pen upright with the mouthpiece facing up when storing it, take brief puffs, as well, clean the mouthpiece's interior regularly, and use the vape pen often rather than leaving it idle for extended periods. By following these steps, you can unclog your vape pen and ensure smooth vapor passage into your lungs.

In conclusion, finding a blockage in your vape pen may be unsettling, but with proper knowledge, you can solve the issue.
