# The Distances among the Particles in the Space 

By: Gholamreza Soleimani<br>https://emfps.blogspot.com/2018/04/the-distances-among-particles-in-space.html

In physics and engineering, the distances among the particles is usually an important factor for analysis of the subject especially when we are studying Newton's law of universal gravitation in mechanic, Coulomb's law in electricity, Maxwell's equations in electromagnetic theory and so on. But, do you think that the application of the theorems in related to the distances among the particles is limited to above laws in classic physics? The most crucial thing is to predict a flexible system which is moving. For instance, suppose you have a bowl filled by water in your hand. When you move, how can you predict the motion of water system into the bowl? Of course, when we are speaking about a rigid system, the prediction and analysis of this system is easy just like when you are moving by a car (an approximately rigid system).

In the reference with article of "A Specific Permutation And Applications (1)" (http://www.emfps.org/2018/03/a-specific-permutation.html), we can derive many conjectures (or theorems) or properties in related to the distances among the particles in the space.
Consequently, this could be conducted as a big project in which I will not be able to handle this project alone.

In this series, I will post little by little these new properties accompanied by examples only related to Newton's law of universal gravitation in mechanic. Since I am using the big data analysis to extract these properties, I have not any pure mathematics proof for them. Therefore, I will mark up them as the Conjectures instead of the Theorems. As the matter of fact, this is the Big Data Analysis with Microsoft excel to create the value from data.

## Conjecture (1):

If above article (A Specific Permutation...) has been applied for only three choices from many events (sample space), we will have the concentric spheres or layered spheres just like below figure:

In previous article, I told you a specific permutation with $n=6$ and $r=3$, gives us 48 points on a sphere, If we increase the sample space ( n ) to 8 and $r=3$, we will have 4 concentric spheres which gives us 48 points on each sphere and for $\mathrm{n}=10$, we will have 10 concentric spheres which gives us 48 points on each sphere and for $\mathrm{n}=12$, we will have 20 concentric spheres which gives us 48 points on each sphere and etc..

In fact, the number of the layered spheres can be calculated by using previous equation divided to
48.

Note: I will again comeback to this conjecture as soon as possible.

## Conjecture (2):

The distance of each point on a sphere is equal to at least five pair points on the same sphere. Suppose points P1, P2, P3, P4, P5, P6, P7, P8, P9, P10, P11 have been located on a sphere. This conjecture says to us:
$d(P 1, P 2)=d(P 1, P 3)=A$
$d(P 1, P 4)=d(P 1, P 5)=B$
$d(P 1, P 6)=d(P 1, P 7)=C$
$d(P 1, P 8)=d(P 1, P 9)=D$
$d(P 1, P 10)=d(P 1, P 11)=E$

Where:
$d(P 1, P 2)=$ the distance between point P1 to P2

The amounts of $A, B, C, D, E$ are the members of real number

Note: I will again comeback to this conjecture as soon as possible.

Conjecture (3):

The distances among the points $P 1(x, y, z), P 2(z, x, y)$ and $P 3(y, z, x)$ are always the same. $d(P 1, P 2)=d(P 1, P 3)=d(P 2, P 3)$

Example:

Suppose point P1 has below coordination:

P1 (3, -5, 11)

Therefore, the coordination P1 and P2 will be:

P2 (11, 3, -5)

P3 (-5, 11, 3)
$\mathrm{d}(\mathrm{P} 1, \mathrm{P} 2)=\mathrm{d}(\mathrm{P} 1, \mathrm{P} 3)=\mathrm{d}(\mathrm{P} 2, \mathrm{P} 3)=19.59592$

Let me tell you an example about Newton's law of universal gravitation as follows:

The Mapping A System of Three Particles for Given Gravity Potential Energy And The Distance

Suppose we have three particles P1, P2 and P3 with the distances among them in infinity which have the masses of $\mathrm{m} 1, \mathrm{~m} 2$ and m 3 . If an external force brings all these particles in new location just like below figure, how can we calculate total work done on them?

It is clear; the work done on particles is equal to total gravity potential energy of system but in opposite direction in which we can write below equation for total gravity potential energy of system:

$$
U(r)=-\left(\frac{G \cdot m_{1} \cdot m_{2}}{r}+\frac{G \cdot m_{1} \cdot m_{3}}{r}+\frac{G \cdot m_{2} \cdot m_{3}}{r}\right)
$$

Where:
$\mathrm{G}=$ Gravitational constant $=6.672 \mathrm{E}-11 \quad(\mathrm{~N} . \mathrm{m} 2 / \mathrm{kg} 2)$
$\mathrm{U}(\mathrm{r})=$ total gravity potential energy of system (J)
$r=$ the distance among the particles (m)
$\mathrm{m} 1, \mathrm{~m} 2, \mathrm{~m} 3=$ mass $(\mathrm{kg})$

Question (1):

If we have:
$\mathrm{U}(\mathrm{r})=-0.04143312 \mathrm{~J}$
$\mathrm{r}=0.0002 \mathrm{~m}$

How can we map these particles in the space?

Step (1):

To find masses of particles, we should apply the method mentioned in article of "Solving a Nonlinear Equation with Many Independent Variables" (http://www.emfps.org/2016/10/can-we-solve-nonlinear-equation-with.html)

I found 6 answers for mass of the particles:

| m 1 | m 2 | m 3 |
| :--- | :--- | :--- |
| 6 | 300 | 400 |
| 6 | 400 | 300 |
| 15 | 380 | 300 |
| 22 | 100 | 1000 |
| 40 | 130 | 700 |
| 40 | 330 | 300 |

Step (2):
Since the distance is equal to 0.0002 m , we can find the coordination of particle P1 by using the model presented in article of "A Model to Track the Location of a Particle in the Space" (http://www.emfps.org/2018/02/a-model-to-track-location-of-particle.html)

I found 408 answers for coordination of particle P1 as follows:

Here I have posted some of the results:

| Models | x | y | z |
| :--- | :--- | :--- | :--- |
| 1 | -0.0005 | 0.00047 | 0.00035 |
| 2 | -0.0005 | 0.00037 | 0.00035 |
| 3 | -0.0005 | 0.00035 | 0.00047 |
| 4 | -0.0005 | - | - |

|  |  | 0.00035 | 0.00037 |
| :---: | :---: | :---: | :---: |
| 5 | $0.00047$ | -0.0005 | $0.00035$ |
| 6 | $0.00047$ | $0.00045 \mid$ | $0.00032$ |
| 7 | $0.00047$ | $0.00035 \mid$ | -0.0005 |
| 8 | $0.00047$ | $0.00035 \mid$ | $0.00032$ |
| 9 | $0.00047$ | $0.00032 \mid$ | $0.00045$ |
| 10 | $0.00047$ | $0.00032 \mid$ | $0.00035$ |
| 11 | $0.00045$ | $\text { \| } 0.00047 \mid$ | $0.00032 \mid$ |
| 12 | $0.00045$ | $\text { \| } 0.00042 \mid$ | $0.00029$ |
| 13 | $0.00045$ | $0.00032 \mid$ | $0.00047$ |

\(\left.\left.\begin{array}{|l|l|l|l|}\hline 14 \& 0.00045 \& 0.00032 \& 0.00029 <br>
\hline 15 \& 0.00045 \& 0.00029 \& 0.00042 <br>
\hline 16 \& 0.00045 \& 0.00029 \& 0.00032 <br>

| 23 | -0.0004 | $0.00042$ | $0.00027 \mid$ |
| 24 | -0.0004 | $0.00037 \mid$ | $0.00024 \mid$ |
| 25 | -0.0004 | $0.00027$ | $0.00042 \mid$ |
| 26 | -0.0004 | $0.00027 \mid$ | $0.00024 \mid$ |
| 27 | -0.0004 | $0.00024$ | $0.00037$ |
| 28 | -0.0004 | $0.00024 \mid$ | $0.00027$ |
| 29 | $0.00037$ | -0.0005 | $0.00035 \mid$ |
| 30 | $0.00037$ | -0.0004 | $0.00024$ |
| 31 | $0.00037$ | $0.00035$ | -0.0005 |
| 32 | $0.00037$ | $0.00035$ | $0.00022 \mid$ |

| 33 | $0.00037$ | $0.00024$ | -0.0004 |
| :---: | :---: | :---: | :---: |
| 34 | $0.00037$ | $0.00024$ | $0.00022$ |
| 35 | $0.00037 \mid$ | $0.00022$ | $0.00035$ |
| 36 | $0.00037$ | $0.00022$ | $0.00024$ |
| 37 | $0.00035$ | -0.0005 | $0.00047$ |
| 38 | $0.00035$ | -0.0005 | $0.00037$ |
| 39 | $0.00035$ | $0.00047 \mid$ | -0.0005 |
| 40 | $0.00035$ | $0.00047$ | $0.00032$ |
| 41 | $0.00035$ | $0.00037$ | -0.0005 |
| 42 | $0.00035$ | $0.00037 \mid$ | $0.00022$ |
| 43 | $0.00035$ | $0.00032$ | $0.00047$ |
| 44 | $0.00035$ | $0.00032$ | $0.00019$ |
| 45 | $0.00035$ | $0.00022 \mid$ | $0.00037$ |
| 46 | $0.00035$ | $0.00022$ | $0.00019$ |
| 47 | $0.00035$ | $0.00019$ | $0.00032$ |

| 48 | $0.00035$ | $0.00019 \mid$ | $0.00022$ |
| :---: | :---: | :---: | :---: |
| 49 | $0.00032$ | $0.00047$ | $0.00045$ |
| 50 | $0.00032$ | $0.00047$ | $0.00035$ |
| 51 | $0.00032$ | $0.00045$ | $0.00047$ |
| 52 | $0.00032$ | $0.00045$ | $0.00029$ |
| 53 | $0.00032$ | $0.00035$ | $0.00047$ |
| 54 | $0.00032$ | $0.00035$ | $0.00019$ |
| 55 | $0.00032$ | $0.00029$ | $0.00045$ |
| 56 | $0.00032$ | $0.00029 \mid$ | $0.00017$ |
| 57 | $0.00032$ | $0.00019$ | $0.00035$ |
| 58 | $0.00032$ | $0.00019$ | $0.00017$ |

Please be informed that each answer gives us a model of three particles P1, P2 and P3. For instance, look at Model (1) in above table. By applying the conjecture (3), you can find below system of articles:

|  | x | y | z | Distance |
| :--- | :--- | :--- | :--- | :--- |
| P1 | -0.0005 | -0.00047 | -0.00035 | 0.00020 |
| P2 | -0.00035 | -0.0005 | -0.00047 | 0.00020 |
| P3 | -0.00047 | -0.00035 | -0.0005 | 0.00020 |

As you can see, the distance among P1, P2 and P3 is equal to 0.0002 m .

Now, please comeback to step (1), we have 6 answers for the masses and for each answer of masses, we have 408 models. It means that we found 2448 systems of three particles which have the same total gravity potential energy.

## Question (2):

If we have:
$\mathrm{U}(\mathrm{r})=-0.01748064 \mathrm{~J}$
$\mathrm{r}=0.0002 \mathrm{~m}$

How can we map these particles in the space?

It is clear, the number of models is 408 but the answers of masses are as follows:

| m 1 | m 2 | m 3 |
| :--- | :--- | :--- |
| 4 | 100 | 500 |
| 10 | 240 | 200 |
| 20 | 20 | 1300 |
| 20 | 220 | 200 |
| 30 | 380 | 100 |
| 31 | 200 | 200 |
| 40 | 60 | 500 |

It means that we found 2856 systems of three particles which have the same total gravity potential energy.

Question (3):

If we have:
$\mathrm{U}(\mathrm{r})=-2.27021 \mathrm{E}-06 \mathrm{~J}$
$\mathrm{r}=1.54 \mathrm{~m}$

How can we map these particles in the space?

The answers for masses are just like to question (2):

| m 1 | m 2 | m 3 |
| :--- | :--- | :--- |
| 4 | 100 | 500 |
| 10 | 240 | 200 |
| 20 | 20 | 1300 |
| 20 | 220 | 200 |
| 30 | 380 | 100 |
| 31 | 200 | 200 |
| 40 | 60 | 500 |

But the answers for step (2) are as follows:

| Models | x | y | z |
| :--- | :--- | :--- | :--- |
| 1 | -0.31 | 0.09 | 0.923333 |
| 2 | -0.31 | 0.523333 | 0.923333 |
| 3 | -0.31 | 0.923333 | 0.09 |
| 4 | -0.31 | 0.923333 | 0.523333 |
| 5 | -0.27667 | 0.123333 | 0.956667 |
| 6 | -0.27667 | 0.556667 | 0.956667 |
| 7 | -0.27667 | 0.956667 | 0.123333 |
| 8 | -0.27667 | 0.956667 | 0.556667 |
| 9 | -0.24333 | 0.156667 | 0.99 |
| 10 | -0.24333 | 0.59 | 0.99 |

| 11 | -0.24333 | 0.99 | 0.156667 |
| :---: | :---: | :---: | :---: |
| 12 | -0.24333 | 0.99 | 0.59 |
| 13 | 0.09 | -0.31 | 0.923333 |
| 14 | 0.09 | 0.923333 | -0.31 |
| 15 | 0.123333 | -0.27667 | 0.956667 |
| 16 | 0.123333 | 0.956667 | -0.27667 |
| 17 | 0.156667 | -0.24333 | 0.99 |
| 18 | 0.156667 | 0.99 | -0.24333 |
| 19 | 0.523333 | -0.31 | 0.923333 |
| 20 | 0.523333 | 0.923333 | -0.31 |
| 21 | 0.556667 | -0.27667 | 0.956667 |
| 22 | 0.556667 | 0.956667 | -0.27667 |
| 23 | 0.59 | -0.24333 | 0.99 |
| 24 | 0.59 | 0.99 | -0.24333 |
| 25 | 0.923333 | -0.31 | 0.09 |
| 26 | 0.923333 | -0.31 | 0.523333 |
| 27 | 0.923333 | 0.09 | -0.31 |
| 28 | 0.923333 | 0.523333 | -0.31 |
| 29 | 0.956667 | -0.27667 | 0.123333 |

| 30 | 0.956667 | -0.27667 | 0.556667 |
| :--- | :--- | :--- | :--- |
| 31 | 0.956667 | 0.123333 | -0.27667 |
| 32 | 0.956667 | 0.556667 | -0.27667 |
| 33 | 0.99 | -0.24333 | 0.156667 |

| 34 | 0.99 | -0.24333 | 0.59 |
| :--- | :--- | :--- | :--- |
| 35 | 0.99 | 0.156667 | -0.24333 |
| 36 | 0.99 | 0.59 | -0.24333 |

In fact, we can find 252 systems of three particles which have the same total gravity potential energy.

As you can see, when the distances increase, the work done on systems will decrease.
The Distances among The Particles in The Space (2)
https://emfps.blogspot.com/2018/04/the-distances-among-particles-in-space-2.html
You can preview the conjectures (1) and (2) and (3) on below link:
http://www.emfps.org/2018/04/the-distances-among-particles-in-space.htm|

## Conjecture (4):

The distances between the point PO ( $a, a, a$ ) and the points mentioned in conjecture (3) are always the same where " $a$ " is a member of real number.

Example:

Suppose we have point P1 with below coordination:

P1 (-3, 15, 34)

According to conjecture (3), the points P2 and P3 will be:

P2 $(34,-3,15)$

P3 (15, 34, -3)

The distances among the points P1 and P2 and P3 are equal to 45.32108.

Assume we have point P0 with below coordination:

PO (56, 56, 56)

The distances between the point $P 0(56,56,56)$ and the points $P 1$ and $P 2$ and $P 3$ is the same and
equal to 75.13987 .
$d(P O, P 1)=75.13987$
$d(P O, P 2)=75.13987$
$d(P O, P 3)=75.13987$

## The Mapping A System of Four Particle for Given Gravity Potential Energy

Suppose we have four particles P0, P1, P2 and P3 with the distances among them in infinity which have the same masses of " $m$ ". If an external force brings all these particles in new location just like
below figure, how can we map the location of these particles for a constant gravity potential energy?

As I told you, suppose that mass of all particles is the same. Therefore, for our analysis, we have three independent variables of " $m$ ", " $r$ " and " $R$ ".

Suppose the constant gravity potential energy is equal -1.008E-08 J
$U(r)=-1.008 E-08 \mathrm{~J}$

As I stated in my previous article, to find the coordination and mapping the particles, we should take two steps:

## Step (1):

To find the mass of particles accompanied by the distances of " $r$ " and " $R$ ", we should apply the method mentioned in article of "Solving a Nonlinear Equation with Many Independent Variables" (http://www.emfps.org/2016/10/can-we-solve-nonlinear-equation-with.html)

I found 8 answers for three independent variables of the particles:

| $\mathbf{m}$ | $\mathbf{r}$ | $\mathbf{R}$ | $\mathbf{T} \mathbf{- G} \mathbf{- P} \mathbf{E}$ |
| :---: | :---: | :---: | :---: |
| 1 | 0.02 | 2.6 | $-1.008 \mathrm{E}-08$ |
| 1 | 0.02 | 2.7 | $-1.008 \mathrm{E}-08$ |
| 1 | 0.02 | 2.8 | $-1.008 \mathrm{E}-08$ |
| 3 | 0.19 | 3 | $-1.008 \mathrm{E}-08$ |
| 3 | 0.21 | 1.2 | $-1.008 \mathrm{E}-08$ |
| 3 | 0.23 | 0.8 | $-1.008 \mathrm{E}-08$ |
| 3 | 0.24 | 0.7 | $-1.008 \mathrm{E}-08$ |
| 4 | 0.36 | 2.7 | $-1.008 \mathrm{E}-08$ |

For example, I choose below three variables from above table:

| $\mathbf{m}$ | $\mathbf{r}$ | $\mathbf{R}$ | T_G_P_E |
| :--- | :--- | :--- | :--- |
| 1 | 0.02 | 2.8 | $-1.007949 \mathrm{E}-08$ |
| 3 | 0.21 | 1.2 | $-1.007949 \mathrm{E}-08$ |
| 3 | 0.24 | 0.7 | $-1.007949 \mathrm{E}-08$ |

And by using these three set, I start step 2.

Step (2):

Since we should get the coordination of particles by using the distances " $r$ ' and " $R$ ", therefore, we have to solve a system of two nonlinear equations as follows:

$$
\left\{\begin{array}{l}
(x-z)^{2}+(y-x)^{2}+(z-y)^{2}=r^{2} \\
(x-a)^{2}+(y-a)^{2}+(z-a)^{2}=R^{2}
\end{array}\right.
$$

By using the model presented in article of "A Model to Track the Location of a Particle in the Space" (http://www.emfps.org/2018/02/a-model-to-track-location-of-particle.html), we can easily find the coordination of the particles.

For instance, if we have:
$\mathrm{m}=1 \mathrm{~kg}$
$r=0.02 \mathrm{~m}$
$R=2.8 \mathrm{~m}$

I found 444 models that some of them are as follows:

| Models | $\times$ | y | $z$ | 3 | Distance |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | -0.02 | -0.01692 | -0.00462 | 1.602721 | 2.8 |
| 2 | -0.02 | -0.01179 | -0.00359 | 1.604772 | 0.02 |
| 3 | -0.02 | -0.00769 | -0.00462 | 1.605798 |  |
| 4 | -0.02 | -0.00462 | -0.01692 | 1.602721 |  |
| 5 | -0.02 | -0.00462 | -0.00769 | 1.605798 |  |
| 6 | -0.02 | -0.00359 | -0,01179 | 1.604772 |  |
| 7 | $-0.01897$ | -0.0159 | -0.00359 | 1.603747 |  |
| 8 | $-0.01897$ | -0.01077 | $-0.00256$ | 1.605798 |  |
| 9 | $-0.01897$ | -0,00667 | -0.00359 | 1.606823 |  |
| 10 | $-0.01897$ | -0.00359 | -0.0159 | 1.603747 |  |

For testing of these models, I use model (1) in above table and we can see the results as follows:

|  | x | y | z | Distance |
| :---: | :---: | :---: | :---: | :---: |
| P1 | -0.0200 | -0.0169 | -0.0046 | 0.01994 |
| P2 | -0.0046 | -0.0200 | -0.0169 | 0.01994 |
| P3 | -0.0169 | -0.0046 | -0.0200 | 0.01994 |
| P0-P3 | 1.60272 | 1.60272 | 1.60272 | 2.80000 |
|  |  |  | P0-P1 | 2.80000 |
|  |  |  | P0 -P2 | 2.80000 |

If we have:
$\mathrm{m}=3 \mathrm{~kg}$
$r=0.21 \mathrm{~m}$
$R=1.2 \mathrm{~m}$

I found 276 models that some of them are as follows:

| Models | $\underline{1}$ | y | $\underline{2}$ | a | Distance |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | 9.79 | 982231 | 995154 | 105439 | 1.2 |
| 2 | 9.79 | 9.91923 | 995154 | 10.5762 | 0.21 |
| 3 | 9.79 | 9.95154 | 9.82231 | 10.5499 |  |
| 4 | 9.79 | 9.95154 | 991923 | 10.5762 |  |
| 5 | 9.80077 | 9.83308 | 9.96231 | 10.5547 |  |
| 6 | 9.80077 | 9.96231 | 9.83308 | 10.5547 |  |
| 7 | 9.81154 | 9.84385 | 9.97308 | 10.5654 |  |

## Conclusion

Suppose you are squeezing a sponge by your hand and assume that the work done by your hand will stay the constant. How can you say that you are controlling the potential energy throughout the sponge when you deform the sponge and change the location of particles of the sponge?

In physics, the people usually use the vector fields, gradient vectors, curl and so on. But the problem is, to encounter with the chaos systems in the nature in which you are not able to find a real function for your subject. In this case, the people usually use the methods of the boundary conditions.

I think that the method mentioned in above article can help us to solve the problems which are defined as the chaos systems.

## The Distances among The Particles in The Space (3)

https://emfps.blogspot.com/2018/04/the-distances-among-particles-in-space-3.html

You can preview the conjectures (1), (2), (3) and (4) on below links:
http://www.emfps.org/2018/04/the-distances-among-particles-in-space.html
http://www.emfps.org/2018/04/the-distances-among-particles-in-space-2.html

## Conjecture (5):

By using this theorem or conjecture, I am willing to show you that there is below figure among five points in the space:

Suppose we have point $\mathrm{P} 1(\mathrm{x}, \mathrm{y}, \mathrm{z})$ and an independent variable " t " where there is below functions between them:

$$
\begin{aligned}
& f(x, y, z, t)=\frac{2(x+y+z)+\sqrt{t^{2}-8(x-y-z)^{2}}}{6} \\
& g(x, y, z, t)=\frac{2(x+y+z)-\sqrt{t^{2}-8(x-y-z)^{2}}}{6}
\end{aligned}
$$

Where:
$t \geq|2 \sqrt{2}(x-y-z)|$ and $x, y, z t \in R$

If points Pm and Pn have below coordination:
$\operatorname{Pm}(f(x, y, z, t), f(x, y, z, t), f(x, y, z, t))$

Pn $(g(x, y, z, t), g(x, y, z, t), g(x, y, z, t))$

Then, in according to conjecture (3), the distance of points Pm and Pn will be equal with the points P1, P2 and P3 stated in conjecture (3). (Please see conjecture (3) on above links).

It means:
$d(P m, P 1)=d(P m, P 2)=d(P m, P 3)=d(P n, P 1)=d(P n, P 2)=d(P n, P 3)=R$

Example (1):

Suppose we have below data:

P1 (-11, 3, 31)
$t=129$

The results will be as follows:

|  | x | y | z | t |
| :---: | :---: | :---: | :---: | :---: |
| P1 | -11 | 3 | 31 | 129 |
| P2 | 31 | -11 | 3 | 129 |
| P3 | 3 | 31 | -11 | 129 |
| $f(x, y, z, t)$ | 11.16667 |  |  |  |
| $g(x, y, z, t)$ | 4.16667 |  |  |  |
|  | x | Y | z |  |
| Pm | 11.16667 | 11.16667 | 11.16667 |  |
| Pn | 4.16667 | 4.16667 | 4.16667 |  |
| d (Pm,P1) | 30.845 |  |  |  |
| d (Pm, P2) | 30.845 |  |  |  |
| d (Pm,P3) | 30.845 |  |  |  |
| d (Pn, P1) | 30.845 |  |  |  |
| d (Pn, P2) | 30.845 |  |  |  |
| d (Pn,P2) | 30.845 |  |  |  |

## Example (2):

Suppose we have below data:

P1 (-3.57, 9.4, -1.84)
$t=32.83$

The results will be as follows:

|  | x | Y | z | t |
| :---: | :---: | :---: | :---: | :---: |
| P1 | -3.57 | 9.4 | -1.84 | 32.83 |
| P2 | -1.84 | -3.57 | 9.4 | 32.83 |
| P3 | 9.4 | -1.84 | -3.57 | 32.83 |
| $f(x, y, z, t)$ | 2.88272 |  |  |  |
| $g(x, y, z, t)$ | $-0.22272$ |  |  |  |
|  | X | Y | z |  |
| Pm | 2.88272 | 2.88272 | 2.88272 |  |
| Pn | -0.22272 | -0.22272 | -0.22272 |  |
| d (Pm,P1) | 10.3158 |  |  |  |
| d (Pm, P2) | 10.3158 |  |  |  |
| d (Pm,P3) | 10.3158 |  |  |  |
| $\mathrm{d}(\mathrm{Pn}, \mathrm{P} 1)$ | 10.3158 |  |  |  |
| d (Pn, P2) | 10.3158 |  |  |  |
| d (Pn,P2) | 10.3158 |  |  |  |

Suppose we have five particles Pm, Pn, P1, P2 and P3 with the distances among them in infinity which have the same masses of " $m$ ". If an external force brings all these particles in new location just like above figure, how can we map the location of these particles for a constant gravity potential
energy?

The method of analysis is just like the steps stated in previous article (http://www.emfps.org/2018/04/the-distances-among-particles-in-space-2.html)

The only difference is to solve a system of three nonlinear equations instead of a system of two nonlinear equations in previous articles as follows:

$$
\left\{\begin{array}{c}
(x-z)^{2}+(y-x)^{2}+(z-y)^{2}=r^{2} \\
f(x, y, z, t)=a \\
g(x, y, z, t)=b
\end{array}\right.
$$

Example:

To simplify above system of equations, I consider " t " as a constant number.

Assume we have:
$r=0.24 \mathrm{~m}$
$t=3$

Thus, we should solve below system of three equations:

$$
\left\{\begin{array}{c}
(x-z)^{2}+(y-x)^{2}+(z-y)^{2}=r^{2} \\
f(x, y, z)=a \\
g(x, y, z)=b
\end{array}\right.
$$

I found 190 models that some of them are as follows:

| Model | $\times$ | $Y$ | 2 | t | $f(x, y, z)$ | $g(x, y, z)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0.751 | 078792 | 0.93562 | 3 | 1.024384 | 0.6253084 |
