

I was reading an article and I came across Decentralization called "a fallacy of structure." giving it a deep thought I kinda agree with this because the general definition of the word decentralization is "No centralized control of power and authority but shared across peers".

It is better to have clear and explicit centers of power with transparency and accountability than pretend your project is decentralized or got no central control in any way, we have seen systems and teams who brag on the inherent characteristics of blockchain technology, decentralization being applied at the core level just for the center of powers and authorities to emerge hidden and unchecked.

Some crypto projects are purely centralized, from the tokenomics structured to give the dev authority to mint unlimited coins or rug pull to the chain going offline and turning off the switch.

As we all say, do your research, and keep refining and reaffirming your reasons for holding a particular project.

We are on a mission of decentralization and we are seeing blockchain technology present endless opportunities.
