

# Why do you need Angular development?

Angular is a **framework** based on JavaScript. It is designed for **developing** web applications with an intuitive and complex architecture. The framework is suitable for the development of delivery service modules and software with status tracking. The Angular team has created such popular services as YouTube and Telegram.

Angular is beneficial to large projects with complex user interfaces. This framework helps developers quickly and efficiently create a user-friendly and intuitive interface that will solve **business problems**.

## Who **needs** Angular development?

The framework aims to extend MVC-based browser apps and make testing and development easier. One of the distinguishing **features** of the framework is the two-way data binding of field values in an HTML page and component controllers. A modular architecture, which allows you to reuse the **app** code effectively, facilitates this process and saves development time.

Angular is suitable for both hybrid and SPA applications. SPA is a one-page site designed in a way that the user does not download new information when going to a pseudo-page. Only dynamic data is updated. Thus, only one loading is required, regardless of which pseudo-page the user is initially on. In standard websites, each new page is pulled up separately.

The new generation of SPA, PWAs, enables the site to work offline. Thanks to Angular, users can download it easily to their smartphones. We should note that such a product cannot load dynamic data. The user will be free to work with content that is already present on the device. But SPA and PWA are not all that can be done with Angular.

What industries is Angular suitable for::

- for **billing** services;
- for embedded delivery modules (API);
- for **E-commerce**;
- for business - corporate websites, etc.

## What services do we offer?

Custom development is beneficial to perform tasks by experienced specialists. In this case, the business saves on office rent, project manager, salary, and taxes.

Using custom Angular development, you don't have to look for a specialist with vast **experience** in the **industry** you need. We offer outsourcing production; our **team** has specialists with extensive experience who have already dealt with similar tasks.

Angular is more suitable for large, rigidly structured projects. It has quite a lot of ready-made solutions, a well-designed system for collecting and storing data. This makes it easier to build large websites and ensures reliable operation.

## What are the areas of Angular development?

**Enterprise** web applications. TypeScript has all the features you need to develop large-scale projects. We equipped TypeScript with auto-completion, advanced refactoring, and navigation features. The architecture of this tool simplifies code reuse and maintenance.

Applications with dynamic content. Since the key goal of Angular was to build single-page web apps, it has a wide range of tools for developing single-page applications or SPA. It is ideal for websites where content must dynamically change based on user behavior and preferences. Dependency injection ensures that if one component changes, it will change automatically the other components associated with it.

Progressive Web Apps (PWA). Google developed the PWA in 2015. These include applications where certain technologies provide reliability, speed, and attractiveness. Angular allows developers to turn native web apps into progressive ones.

Therefore, it is possible to highlight those projects that do not need Angular. These include lightweight sites with static content, SEO-optimized sites, short-term projects, and applications built using a microservices architecture.

Our **Angular development agency** offers a comprehensive solution for different areas.

## Why Choose Intelini as your Angular Developer

Intelini is an **AngularJS Development Company** providing software development services. Note that apps' development in Angular has a lot of features that specialists need to be aware of. They must perfectly understand all the functionality and the framework tools. Our specialists have a fairly high level of qualification, which is enough to create diverse applications of various complexity levels for any **platform** and any task within a short period of time.

Why you need Angular development?  
Angular is a framework by Google based on JavaScript. Its peculiarity is that it helps developers to quickly create understandable and complex web applications. It is needed to develop web applications for different purposes. This framework is suitable for creating a delivery service for example, you can create a delivery service or an application with tracking the status of a loyalty programme on it. Popular services such as YouTube and Telegram standalone applications are written on this framework.  
Angular is useful for creating large web applications and complex user interfaces. It will allow you to quickly and efficiently create a convenient and intuitive interface that will solve the problems of the business.

Who needs Angular development?  
The goal of this framework is to extend MVC-based browser applications and make testing and development easier. One of the distinguishing features of the framework is the two-way data binding of field values in an HTML page and component controllers. This is facilitated on modular architecture, which allows you to effectively reuse the app code, saving development time.  
Angular is suitable for both hybrid and SPA applications. SPA is a one-page site designed in such a way that by going to a pseudo-page the user does not download new information. Only dynamic data is updated. Thus, loading is required only once, regardless of which pseudo-page the user is on first. In standard websites, each new page is pulled up separately.  
The new generation of SPA, PWAs, is being created to enable the site to work offline as well. They can be downloaded quite easily to your smartphone. This is really possible, and that's what Angular is for. It should be taken into account that such a product cannot load dynamic data. The user will be free to work with content that is already present on the device. But SPA and PWA are not all that can be done with Angular.  
For which industry is the Angular solution suitable: for billing services; for embedded delivery modules (API); for E-commerce; for business development of corporate websites, etc.

What services do we offer?  
Any custom development is profitable for the company, if only because it does not take on the responsibility for completing the task, but delegates it to a specialist who has been doing this for several years. In this case, the business saves money on office rental, project manager, salaries, and taxes.  
And in the case of custom Angular development, you don't have to look for a developer who has a lot of experience in the industry you need. We offer outsourcing production; our team has specialists with extensive experience who have already dealt with similar tasks.  
Angular is more suitable for large, rigidly structured projects. It has quite a lot of ready-made solutions, a more thought-out system for collecting and storing information. This makes it easier to build large websites and ensures reliable operation.
